TITLE OF INVENTION

Thixotropic Formulations for Filling Hard Capsules

APPLICANT(S) FOR DO/EO/US Pascal Lombardin, Jean-Louis Grossiord, Monique Seiller,
Elie Leverd, Eric Goutay, and Joël Bougaret

Applicant herewith submits to the United States Designated/Elected Office (DO/EO/US) the following items and other information:

1. ☒ This is a **FIRST** submission of items concerning a filing under 35 U.S.C. 371.
2. ☐ This is a **SECOND** or **SUBSEQUENT** submission of items concerning a filing under 35 U.S.C. 371.
3. ☐ This is an express request to promptly begin national examination procedures (35 U.S.C. 371(f)).
4. ☐ The US has been elected by the expiration of 19 months from the priority date (PCT Article 31).
5. ☒ A copy of the International Application as filed (35 U.S.C. 371(c)(2))
 - a. ☐ is attached hereto (required only if not communicated by the International Bureau).
 - b. ☒ has been communicated by the International Bureau.
 - c. ☐ is not required, as the application was filed in the United States Receiving Office (RO/US).
6. ☒ An English language translation of the International Application as filed (35 U.S.C. 371(c)(2)).
7. ☒ Amendments to the claims of the International Application under PCT Article 19 (35 U.S.C. 371(c)(3))
 - a. ☐ are attached hereto (required only if not communicated by the International Bureau).
 - b. ☒ have been communicated by the International Bureau.
 - c. ☐ have not been made; however, the time limit for making such amendments has NOT expired.
 - d. ☐ have not been made and will not be made.
8. ☐ An English language translation of the amendments to the claims under PCT Article 19 (35 U.S.C. 371(c)(3)).
9. ☒ An oath or declaration of the inventor(s) (35 U.S.C. 371(c)(4)).
10. ☐ An English language translation of the annexes to the International Preliminary Examination Report under PCT Article 36 (35 U.S.C. 371(c)(5)).

Items 11 to 16 below concern document(s) or information included:

11. ☐ An Information Disclosure Statement under 37 CFR 1.97 and 1.98.
12. ☐ An assignment document for recording. A separate cover sheet in compliance with 37 CFR 3.28 and 3.31 is included.
13. ☒ A **FIRST** preliminary amendment.
☐ A **SECOND** or **SUBSEQUENT** preliminary amendment.
14. ☐ A substitute specification.
15. ☐ A change of power of attorney and/or address letter.
16. ☐ Other items or information:

PRELIMINARY AMENDMENT

As soon as the Serial Number and the Filing Date have been
accorded the above-identified application, please enter the
following amendment:

IN THE CLAIMS:

Claims 2-10, line 1 of each: Change "Compositions" to --A
composition--.

Claim 3, line 1: Delete "or 2".

line 2: Delete the line and insert --which contains--.

Claim 5, line 1: Delete "or 4".

Claim 6, line 1: Change "one of claims 3 to 5" to --claim
3--.

Claim 8, line 1: Change "one of claims 3 to 7" to --claim
3--.

Claim 10 lines 1 and 2: Change "one of the preceding
claims" to --claim 1--.

R E M A R K S

A few constructive editorial changes have been made in the
claims to bring them somewhat more into line with US practice and
requirements.

Entry of the amendments and favorable action on the merits
are all hereby respectfully solicited.

Respectfully submitted,

THE FIRM OF HUESCHEN AND SAGE

"Thixotropic formulations for filling hard capsules"

5 The present invention relates to thixotropic pharmaceutical or veterinary, dietary or cosmetic compositions containing one or more active substances intended for filling capsules with a hard casing, called hard capsules, at room temperature.

10 The term "room temperature" is understood to mean a temperature substantially between 15 and 30°C.

 Two types of capsules are used for medicinal products intended for oral, rectal or vaginal administration, namely capsules with a soft case and
15 capsules with a hard case.

 Individual liquid or pasty pharmaceutical compositions are conventionally presented in soft capsules. However, the process for manufacturing soft capsules requires the use of complex plants and
20 specialized custom molders, so that the use of hard capsules may, for economic reasons, be preferred.

 Hard capsules are conventionally used for packaging solid substances such as powders and granules. In some cases, filling hard capsules with
25 solid substances poses certain technical problems such as, on the one hand, the generation of contaminating dust when handling active and toxic substances (anticancers, hormones) - something which may prove to be particularly dangerous - and, on the other hand, the
30 nonuniform filling from one hard capsule to another when the active substance or substances are lightly dosed.

 This is why a solid active substance may be combined with a liquid vehicle before being packaged in
35 hard capsules (US H 672).

 The use of a liquid vehicle for the filling of hard capsules also raises problems, since the liquid can flow out between the body and the top of the hard

capsule. Leaks are generally avoided by sealing the hard capsules (EP 488 181 and WO-91/02520). This sealing operation requires a particular know-how and an additional step incurring a not insignificant additional cost.

An alternative to sealing the hard capsules has been proposed. It consists in filling the hard capsules with a composition containing the active principle in the dissolved or dispersed state. This same composition is liquid or pasty and of low viscosity during the filling and it then thickens inside the hard capsules.

According to a first filling mode, called "hot filling", the composition, which is pasty at room temperature, is thinned by heating (EP-49 909). This method cannot be applied to heat-sensitive active principles such as certain anticancer agents, vitamins and antibiotics.

According to a second filling mode, called "room-temperature filling", GB-1 590 864 provides compositions such that

- their viscosity at $20 \pm 1^\circ\text{C}$ is between 500 and 5000 mPa.s, preferably between 1000 and 3000 mPa.s, measured at 450 revolutions per minute on a Haake viscosimeter,

and such that

- their surface tension is greater than 20 dynes/cm, preferably greater than 30 dynes/cm.

However, GB-1 590 864 does not specify what the viscosity of the compositions at rest must be.

Moreover, a third filling mode, combining the first two, has been described in EP-49 909. According to this method, a shear-thinning composition, containing liquid paraffin, hydrogenated castor oil and colloidal silica, is heated to 40°C .

The Applicant has demonstrated that the shear-thinning nature of the compositions for filling hard capsules of the prior art, although necessary for ensuring proper filling of the hard capsule, nevertheless proves to be insufficient.

This is because it is also imperative to check that the formulation at rest in the hard capsule restructures sufficiently strongly and above all sufficiently quickly, after filling, to avoid any leakage between the two parts of the hard capsule.

It is therefore absolutely essential for the consistency of the composition at rest to be sufficient to avoid any flow of the composition between the two parts of the hard capsule.

Among the raw materials that are used in conventional filling compositions are polyethylene glycols. Polyethylene glycols are intended to dissolve the water-soluble active principle of the filling composition, by virtue of their hydrophilic properties (EP-276 116, EP-488 181 and EP-49 909).

It has been found that the incorporation, as continuous phase, of polyethylene glycols, and more particularly of polyethylene glycols of low average molecular masses, in the filling composition may pose serious physicochemical interaction problems and therefore stability problems.

In particular, these polyethylene glycols are hygroscopic and attract water from the gelatin into the continuous phase making the case brittle and weak during storage.

The filling compositions of the present invention are advantageously free of any polyethylene glycol, and in particular of polyethylene glycol of low average molecular mass, which would run the risk of weakening the case of the hard capsules.

The objective of the present invention is to provide compositions termed "thixotropic" compositions containing one or more active substances which allow easy filling of the hard capsules at room temperature

and which ensure the absence of leaks between the two parts of the hard capsule without it being necessary to make use of the sealing usually recommended for this type of pharmaceutical dosage form.

5 The rheological properties of the formulations of the invention ensure effective filling at room temperature and the absence of leaks from the filled hard capsules.

10 It will be recalled that a liquid or pasty thixotropic composition has a shear-thinning character which is manifested by a reduction in the apparent viscosity under the effect of increasing shear. Furthermore, any variation in the shear conditions causes a structural modification delayed over time.
15 Thus, in particular a gradual, total or partial recovery in consistency is observed after the shear has stopped.

20 The rheological parameters chosen as being particularly representative of the consistency of the formulations are:

- the complex modulus G^* , the value of which is greater the thicker the product under study, which complex modulus is a synthesis of the elastic and viscous properties of the material, and
25
- the phase shift δ , of between 0° and 90° , knowing that a phase shift of greater than 45° characterizes a predominantly viscous nature and, conversely, a
30 phase shift of less than 45° demonstrates a predominantly elastic nature characteristic of a structured material.

35 The present invention relates to liquid or pasty thixotropic compositions containing one or more active substances, intended for filling hard capsules at room temperature, such that:

- their complex modulus G^* is greater than about 100 Pa,
- their phase shift δ is less than about 45° ,
- their viscosity decreases with increasing shear rate,
- under the effect of a constant shear rate γ_0 , the viscosity of the said compositions decreases in a delayed manner over time and stabilizes at the equilibrium value η_{eq} of between 10 mPa.s and about 10 000 mPa.s, when γ_0 is between 100 and 1000 s^{-1} and
- after making the said shear rate 0, the complex modulus and the phase shift of the said compositions resume, after a time t of less than 1 hour, G^* and δ values of greater than about 100 Pa and of less than about 45° , respectively.

The compositions according to the invention are therefore defined, on the one hand, by their shear-thinning nature, that is to say that their viscosity decreases when the intensity of the shear increases and, on the other hand, by the decrease in their viscosity over time for a given shear.

The formations of the invention thus thin in the hard-capsule filling machine due to the effect of the shear induced by the agitation present from the feed hopper right to the dispensing nozzle. This property makes it particular easy to fill the hard capsules.

For each shear rate, the viscosity of the compositions of the invention decreases over time and finally stabilizes at an equilibrium value denoted η_{eq} .

The compositions according to the invention have equilibrium viscosities η_{eq} at 100 s^{-1} and 1000 s^{-1} of between 10 mPa.s and 10 000 mPa.s, preferably between 100 mPa.s and 1500 mPa.s. It is entirely unnecessary to

make use of a heating operation, as required in certain processes of the prior art (US-4 450 877).

The compositions according to the invention are also defined by a significant recovery in consistency
5 delayed over time.

The compositions of the invention, thinned in the hard-capsule filling machine, resume their initial consistency after a sufficient rest time, so as to avoid any risk of a leak from the full capsule.

10 The formulations according to the invention are characterized by G^* values of greater than 100 Pa, preferably greater than 1000 Pa, and/or δ values of less than 45° , preferably less than 25° , and/or a recovery time t of less than 1 hour and preferably less
15 than 30 minutes, and/or η_{eq} values of between 100 mPa.s and 1500 mPa.s when the shear rate is between 100 and 1000 s^{-1} .

Once the recovery has been completed, G^*_{eq} is greater than 100 Pa, preferably 1000 Pa, and δ_{eq} is less
20 than 45° , preferably less than 25° .

The hard capsules used within the context of the present invention consist of gelatin, of a cellulose polymer (such as hydroxypropylmethyl cellulose) or of any other polymer capable of
25 fulfilling the use functions of gelatin in the form of a hard capsule.

According to a preferred embodiment, the thixotropic compositions of the present invention are dispersions containing a continuous liquid or pasty
30 dispersing phase, a viscosity-modulating dispersed phase in the particulate or micellar state and at least one active substance present in the dissolved and/or dispersed state.

The dispersing phases of the invention are
35 characterized by their wide polarity range in terms of hydrophilic-lipophilic balance (HLB). The raw materials used in the formulation of these dispersing phases of the invention have hydrophilic, lipophilic or amphiphilic properties of variable HLB which allow the

dissolution or dispersion of liquid and solid active principles which are themselves hydrophilic, lipophilic or amphiphilic.

5 The continuous phase of these compositions advantageously consists of at least one vehicle such as oils, their derivatives, and more particularly amphiphilic esters having an HLB of between 3 and 15, such as amphiphilic polyglycolized glycerides, like LABRASOL® and LABRAFIL® sold by Gattefosse.

10 The use of amphiphilic vehicles having a hydrophilic tendency represents a good alternative to the hydrophilic polyethylene glycols of the prior art. Apart from polyethylene glycols, the products conventionally used in the formulation of liquid or
15 pasty thixotropic preparations for a hard capsule are rather lipophilic (GB-1 590 864, US-4 450 877, US-H672, EP-461 290).

The amphiphilic continuous phases having a hydrophilic tendency used within the context of the
20 present invention, unlike the excipients of the prior art, prove to be ideally suited to hydrophilic, lipophilic or amphiphilic active principles, whether they dissolve or disperse respectively.

The viscosity-modulating dispersed phase of the
25 compositions according to the invention may be chosen from hydrophilic or hydrophobic pyrogenic silica particles, the mean size of which may be between 5 and 50 nm, preferably between 7 and 20 nm, and the specific surface area between 10 and 450 m²/g, preferably
30 between 70 and 410 m²/g, such as AEROSIL® sold by Degussa, and ethylene oxide and propylene oxide copolymers, such as SYNPERONIC® products sold by ICI, and mixtures thereof.

The dispersed phase combined with the
35 continuous phase makes it possible to achieve HLB values ranging up to about 20.

The viscosity-modulating dispersed phase of the compositions according to the invention preferably

represents from 1 to 30% m/m, more preferably from 5 to 15% m/m, of the preparation.

The excipients used in the formulation of the thixotropic compositions according to the invention are
5 chosen from pharmaceutically acceptable excipients that are inert with respect to the active substances that it is desired to formulate.

Furthermore, these excipients are chosen from excipients that are compatible with the casing of the
10 hard capsules.

The excipients which are used in the formulation of the thixotropic compositions according to the invention are advantageously endowed with hydrophilic, lipophilic or amphiphilic properties with,
15 for these, a variable hydrophilic-lipophilic balance (HLB), which allow the dissolution or dispersion of both hydrophilic and lipophilic active substances. The HLB of the vehicles may vary from 4 ± 1 for a combination of LABRAFIL® M1944CS and AEROSIL® to 20 ± 1
20 for a combination of LABRASOL® and SYNPERONIC®.

The compositions according to the invention contain an active substance which may be liquid or pasty but also solid, for example milnacipran hydrochloride (solubility in water of 600 g/l),
25 baquimast (solubility in water of 0.23 g/l), nifedipine, triamterene, aluminum hydroxylchloride, sodium salicylate, vancomycin, paramethadone and griseofulvin.

The hard capsules used within the context of the present invention consist of gelatin or of any
30 other cellulose polymer capable of fulfilling the functions of the use of gelatin in the form of a hard capsule, such as hydropropylmethyl cellulose.

The invention is not limited to these examples
35 and a person skilled in the art will be easily able to include any active substance of his choice, whether liquid, pasty or even solid, in the compositions described.

The present invention also relates to the use of the compositions described above in a cosmetic, dietary, pharmaceutical or veterinary preparation.

The present invention is illustrated by the following examples with reference to the appended figures:

- figure 1 shows the rheogram of a formulation of example 4 of the invention and the rheogram of a composition of example 5, the rheological properties of which do not meet the criteria of the invention.

The stress (in pascals) is plotted on the y-axis and the shear rate (in s^{-1}) is plotted on the x-axis;

- figure 2 gives the time dependence of the recovery in consistency of two formulations of the invention, that of example 2 and that of example 4.

The complex modulus, expressed in pascals, is plotted on the y-axis and the time is plotted on the x-axis;

- figures 3 and 4 represent the degree of dissolution as a percentage (on the y-axis) of a formulation of example 1 and of a formulation of example 2, respectively, as a function of time (on the x-axis) expressed in hours and in minutes, representively.

EXAMPLES 1 TO 7:

a) Preparation of the dispersions:

Seven dispersions were prepared, each containing a continuous phase, a dispersed phase and an active phase.

The continuous phase consisted of an amphiphilic ester such as LABRAFIL M1944CS® (HLB = 4 ± 1) or LABRASOL® (HLB = 14 ± 1). It should be mentioned at this stage that the amphiphilic esters

that can be used within the context of the invention may have HLB values of between 3 and 15.

The dispersed phase was chosen from AEROSIL 200 V® (a hydrophilic pyrogenic silica),
5 AEROSIL R 974® (a hydrophobic pyrogenic silica) and SYNPERONIC PE/F 68® (an ethylene oxide/propylene oxide copolymer having an HLB of 29 ± 1). When the dispersed phase chosen was SYNPERONIC®, the HLB of the dispersing phase increased to about 20.

10 The active substance was chosen from milnacipran hydrochloride (a solid whose solubility in water is 600 g/l) and baquimast (a solid whose solubility in water is 0.23 g/l).

The preparations containing pyrogenic silica as
15 dispersed phase were obtained by gradually adding silica to the amphiphilic ester with vigorous stirring, advantageously at between 1000 and 3000 revolutions per minute. The mixture was then put under vacuum and the stirring continued after incorporating the silica until
20 homogeneous. The preparations containing SYNPERONIC® as dispersed phase were obtained by gradually adding SYNPERONIC® to the amphiphilic ester with moderate stirring, advantageously at between 400 and 800 revolutions per minute. The mixture was then put under
25 vacuum and the stirring continued until homogeneous.

Whether the preparations contained AEROSIL® or SYNPERONIC® as viscosity-modulating dispersed phase, the active substance chosen was always added to the amphiphilic ester/dispersed phase mixture at room
30 temperature with moderate stirring. The composition of each dispersion is given in detail in table I below.

b) Rheological properties

35 The rheological properties of the seven preparations were then studied in terms of shear thinning and of recovery in consistency.

b1) The shear thinning is characterized at 25°C in terms of flow rheology in a rotating controlled-stress rheometer (Carri-Med CSL100).

The "stress as a function of shear rate" rheogram is plotted for each of the dispersions. The rheogram makes it possible to check the ability of a preparation to undergo thinning when the intensity of the shear increases.

Since the viscosity is defined as the ratio of the stress to the shear rate, a convex curve is an expression of a decrease in the viscosity with shear rate, that is to say a shear-thinning behavior, whereas a concave curve is an expression of an increase in the viscosity with shear rate, i.e. a shear-thickening behavior.

Figure 1 shows the rheogram for two dispersions, dispersion 4 and dispersion 5, the compositions of which are given in table I above. The line of the rheogram for dispersion 4, which is convex, means that dispersion 4 is shear thinning and meets one of the criteria of the compositions of the invention, whereas that for preparation 5, which is concave, demonstrates its shear-thickening character.

Table I specifies the observed shear-thinning or shear-thickening character in light of the rheogram for each dispersion.

The formulations were also subjected to constant shear rates of the same order of magnitude as those involved in a hard-capsule filling machine of conventional type (100 s^{-1} for the lines in the machine and 1000 s^{-1} for the narrowing at the exit of the injection nozzle).

For each shear rate, it may be seen that there is a reduction in the viscosity over time, which finally stabilizes at an equilibrium value denoted η_{eq} . The results are given in table I.

The seven dispersions have equilibrium viscosities, at a shear rate of 100 s^{-1} or 1000 s^{-1} , of between 100 mPa.s and 5000 mPa.s.

These viscosity values consequently prove to be suitable for the automatic filling of hard capsules. It is entirely unnecessary to thin our thixotropic dispersions further by raising the filling temperature, as recommended by the authors of patent US-4 450 877.

5 b2) The rheological conditions relating to the resumption of thixotropy, and which guarantee that there are no leaks long term, were determined at 25°C, in dynamic rheology, in a controlled-stress Couette-type rotating rheometer (Carri-Med CSL 100).

This mode of study, unlike flow rheology, allows the consistency of a material "at rest" to be assessed since it is possible to apply appreciably smaller strains to the material than in flow.

15 The seven dispersions were presheared for 15 minutes at 1000 s^{-1} .

The parameters used to characterize the recovery in consistency are the magnitude of the recovery (expressed as a percentage), the complex modulus G^* (in pascals) after recovery and the phase shift δ (in degrees) 1 hour after stopping the shear and the time $t_{50\%}$ for the recovery to reach 50% with respect to G^*_{eq} . The results are summarized in table I above.

25 The percentage recovery in consistency of the shear-thinning dispersions 1, 2, 3, 4, 6 and 7 is equal to 100%. The recovery is therefore total. The values of the G^* recovery after 1 hour are total and greater than 100 Pa in respect of preparations 1, 4 and 7, but less than 100 Pa in respect of preparations 5 and 6, which reach values of 5 and 70 Pa, respectively.

30 After recovery, δ is less than 25° for all the dispersions, with the exception of dispersion 5 (equal to 71°).

35 For the five shear-thinning dispersions, $t_{50\%}$ is less than 30 minutes.

Dispersions 1, 2, 3, 6 and 7 therefore undergo rapid and total recovery in their consistency, which furthermore is considerable.

Figure 2 shows the change in G^* as a function of time for dispersions 2 and 4. It may be seen that the recovery in consistency of dispersion 2 is very rapid ($t_{50\%} = 1$ s) and considerable (after recovery $G^* = 1400$ Pa), that of dispersion 4 is slower ($t_{50\%} = 23$ min.) and considerable (after recovery $G^* = 900$ Pa).

c) Hard-capsule stability study

10

Having studied the rheological properties of the dispersions, they were dispensed into size-1 conventional-closure hard gelatin capsules at room temperature using an industrial-type filling machine. The filling was carried out with a coefficient of variation in the mass of the filled hard capsule which was systematically less than 1.5%.

The filled hard capsules were stored for 12 months in an oven ($25^\circ\text{C} \pm 2^\circ\text{C}$ and $60\% \text{ RH} \pm 5\% \text{ RH}$) in order to confirm that there were no leaks and no deformation in the casing of the capsule. Only the capsules containing preparations 5 and 6 had leaks during storage.

d) Hard-capsule *in vitro* release study

In vitro release studies, performed in a "Dissolutest" (water at $37 \pm 0.5^\circ\text{C}$, 100 tpm), were carried out. The results for preparations 1 and 2 are given in figures 3 and 4, respectively.

The release of milnacipran hydrochloride (a solid water-soluble active principle) is more rapid the more hydrophilic the continuous phase.

Under the operating conditions employed, preparation 2 (figure 4) containing an amphiphilic ester having a hydrophilic tendency ($\text{HLB} = 14$) releases the active principle very much more rapidly than preparation 1 (figure 3) containing an amphiphilic ester having a lipophilic tendency ($\text{HLB} = 4 \pm 1$).

10.1016/j.jmb.2005.08.005

TABLE I: COMPOSITIONS AND CRITICAL RHEOLOGICAL PARAMETERS OF THE DISPERSION EXAMPLES

Ex am p l e s	Formulation: Continuous phase Dispersed phase Active principle (% m/m)	Thixotropy characterization							Stability: 25 ± 2°C: 60% ± 5% RH (12 months)

CLAIMS

1. Liquid or pasty thixotropic compositions containing one or more active substances, intended for filling hard capsules at room temperature, such that:

- their complex modulus G^* is greater than about 100 Pa,
- their phase shift δ is less than about 45° ,
- their viscosity decreases with increasing shear rate,
- under the effect of a constant shear rate γ_0 , the viscosity of the said compositions decreases in a delayed manner over time and stabilizes at the equilibrium value η_{eq} of between 10 mPa.s and about 10 000 mPa.s, when γ_0 is between 100 and 1000 s^{-1} and
- after making the said shear rate 0, the complex modulus and the phase shift of the said compositions resume, after a time t of less than 1 hour, G^* and δ values of greater than about 100 Pa and of less than about 45° , respectively.

2. Compositions according to claim 1, characterized in that:

G^* is greater than 1000 Pa, and/or

δ is less than 25° and/or

η_{eq} is between 100 and 1500 mPa.s when γ_0 is between 100 and 1000 s^{-1} and/or

t is less than 30 min.

3. Compositions according to claim 1 or 2, characterized in that they are preparations containing a continuous dispersing phase, a dispersed phase and at least one active substance.

4. Compositions according to claim 3, characterized in that the continuous phase consists of at least one vehicle such as amphiphilic esters having an HLB of between 3 and 15 and more particularly polyglycolized glycerides.
5. Compositions according to claim 3 or 4, characterized in that the dispersed phase is chosen from hydrophilic or hydrophobic pyrogenic silica particles and ethylene oxide/propylene oxide copolymers, the latter making it possible to achieve, when combined with the continuous phase, HLB values ranging up to about 20.
6. Compositions according to one of claims 3 to 5, characterized in that the active substance is liquid, pasty or solid.
7. Compositions according to claim 6, characterized in that the active substance is chosen from milnacipran hydrochloride, baquimast, nifedipine, triamterene, aluminum hydroxylchloride, sodium salicylate, vancomycin, paramethadone and griseofulvin.
8. Compositions according to one of claims 3 to 7, characterized in that the dispersed phase of the preparations according to the invention represents 1 to 30% m/m of the preparation.
9. Compositions according to claim 8, characterized in that the dispersed phase of the dispersions according to the invention represents from 5 to 15% m/m of the preparation.
10. Compositions according to one of the preceding claims, characterized in that the hard capsules consist of gelatin or of any other cellulose polymer capable of fulfilling the functions of the use of gelatin in the form of a hard capsule, such as hydroxypropylmethyl cellulose.

Declaration and Power of Attorney For Patent Application

English Language Declaration

As a below named inventor, I hereby declare that:

My residence, post office address and citizenship are as stated below next to my name,

I believe I am the original, first and sole inventor (if only one name is listed below) or an original, first and joint inventor (if plural names are listed below) of the subject matter which is claimed and for which a patent is sought on the invention entitled.

THIXOTROPIC FORMULATIONS FOR FILLING HARD CAPSULES

the specification of which (check one of the following)

☐ is attached hereto; ☐ was filed on _____ as Application Serial

No. _____ and was amended on _____ (if applicable)

☒ was filed as PCT International Application No. PCT/FR99/01614
on 05 JULY 1999 and was amended under PCT Article 19 on _____ (if applicable)

I hereby state that I have reviewed and understand the contents of the above identified specification, including the claims, as amended by any amendment referred to above.

I acknowledge the duty to disclose information which is material to the examination of this application in accordance with Title 37, Code of Federal Regulations, § 1.56(a).

I hereby claim foreign priority benefits under Title 35, United States Code, § 119 of any foreign application(s) for patent or inventor's certificate listed below and have also identified below any foreign application for patent or inventor's certificate having a filing date before that of the application on which priority is claimed:
